Recombinant Human IL-4
Catalog Number: 204-IL/CF

DESCRIPTION
Source
E. coli-derived human IL-4 protein
His25-Ser153, with an N-terminal Met
Accession # P05112

N-terminal Sequence
Analysis
Predicted Molecular Mass
15 kDa

SPECIFICATIONS
SDS-PAGE
14 kDa, reducing conditions
Activity
The ED50 for this effect is 0.0500-0.200 ng/mL.

Endotoxin Level
<0.10 EU per 1 µg of the protein by the LAL method.
Purity
>97%, by SDS-PAGE under reducing conditions and visualized by silver stain.
Formulation
Lyophilized from a 0.2 µm filtered solution in PBS. See Certificate of Analysis for details.

PREPARATION AND STORAGE
Reconstitution
Reconstitute at 100-200 µg/mL in sterile PBS.

Shipping
The product is shipped at ambient temperature. Upon receipt, store it immediately at the temperature recommended below.

Stability & Storage
Use a manual defrost freezer and avoid repeated freeze-thaw cycles.
• 12 months from date of receipt, -20 to -70 °C as supplied.
• 1 month, 2 to 8 °C under sterile conditions after reconstitution.
• 3 months, -20 to -70 °C under sterile conditions after reconstitution.

DATA
Recombinant Human IL-4 Protein Bioactivity
Comparison. As an alternative, please consider our next generation Recombinant Human IL-4 (Catalog # BT-004). It has equivalent bioactivity to Recombinant Human IL-4 (Catalog # 204-IL/CF). It combines R&D Systems quality with scalability that allows for a solid supply chain. Both Recombinant Human IL-4 proteins are measured in a cell proliferation assay using TF-1 human erythroleukemic cell line.

Bioactivity

Recombinant Human IL-4 (ng/mL)

Mean RFU

Equivalent Bioactivity of GMP, Animal-Free, and RUO grades of Recombinant Human IL-4 as measured in cell proliferation assay (orange, green, red, respectively).
Interleukin-4 (IL-4), also known as B cell-stimulatory factor-1, is a monomeric, approximately 13 kDa-18 kDa Th2 cytokine that shows pleiotropic effects during immune responses (1-3). It is a glycosylated polypeptide that contains three intrachain disulfide bridges and adopts a bundled four α-helix structure (4). Human IL-4 is synthesized with a 24 aa signal sequence. Alternate splicing generates an isoform with a 16 aa internal deletion. Mature human IL-4 shares 55%, 39% and 43% aa sequence identity with bovine, mouse, and rat IL-4, respectively. Human, mouse, and rat IL-4 are species-specific in their activities (5-7). IL-4 exerts its effects through two receptor complexes (8, 9). The type I receptor, which is expressed on hematopoietic cells, is a heterodimer of the ligand binding IL-4 Rα and the common γ chain (a shared subunit of the receptors for IL-2, -7, -9, -15, and -21). The type II receptor on nonhematopoietic cells consists of IL-4 Rα and IL-13 Rα1. The type II receptor also transduces IL-13 mediated signals. IL-4 is primarily expressed by Th2-biased CD4+ T cells, mast cells, basophils, and eosinophils (1, 2). It promotes cell proliferation, survival, and immunoglobulin class switch to IgG4 and IgE in human B cells, acquisition of the Th2 phenotype by naïve CD4+ T cells, priming and chemotaxis of mast cells, eosinophils, and basophils, and the proliferation and activation of epithelial cells (10-13). IL-4 plays a dominant role in the development of allergic inflammation and asthma (12, 14).
