**BACKGROUND**

As downstream targets of the Rho GTPases, the p21-activated kinase (PAK) family of serine/threonine kinases regulates the organization of the actin cytoskeleton in mammalian cells. The PAK family is structurally categorized in two groups, each with three members: group I PAK1-3; and group II PAK4-6. Targeted disruption of PAK4 in mice leads to severe defects in the development and migration of neurons, suggesting a key role for this kinase in neuronal development.
