

DESCRIPTION		
Species Reactivity	Human	
Specificity	This antibody binds to CHO cells transfected with human P-Selectin but not to CHO cells transfected with either human E-Selectin or humar L-Selectin.	
Source	Monoclonal Mouse IgG ₁ Clone # 9E1	
Purification	Protein A or G purified from hybridoma culture supernatant	
Immunogen	Recombinant human P-Selectin Extracellular domain	
Conjugate	Fluorescein Excitation Wavelength: 488 nm Emission Wavelength: 515-545 nm (FITC)	
Formulation	Supplied in a saline solution containing BSA and Sodium Azide. See Certificate of Analysis for details.	
	*Contains <0.1% Sodium Azido, which is not hazardous at this concentration according to CHS electifications. Pofer to the Sofaty Data Sheet	

*Contains <0.1% Sodium Azide, which is not hazardous at this concentration according to GHS classifications. Refer to the Safety Data Sheet (SDS) for additional information and handling instructions.

APPLICATIONS			
Please Note: Optimal dilutions should be determined by each laboratory for each application. General Protocols are available in the Technical Information section on our website.			
	Recommended Concentration	Sample	
Flow Cytometry	10 μL/10 ⁶ cells	See Below	

BACKGROUND

Human P-Selectin, also known as GMP-140, LECAM-3, PADGEM, and CD62P, is a member of the Selectin family, and is a cell surface glycoprotein expressed by activated platelets and endothelial cells. P-Selectin is translocated to the cell surface within minutes, from alpha granules of platelets or Weibel-Palade bodies of endothelial cells, following stimulation with thrombin, histamine, PMA or peroxides. P-Selectin binds to a 106 kDa protein present on myeloid cells, neutrophils, monocytes and lymphocytes, termed PSGL-1 (P-Selectin Glycoprotein Ligand-1).

P-Selectin plays a role in the adhesion of leukocytes and neutrophils to the endothelium. Acting in cooperation with L-Selectin, P-Selectin mediates the initial interaction of circulating leukocytes with endothelial cells that produces a characteristic 'rolling' of the leukocytes on the endothelium. This initial interaction is followed by a stronger interaction involving E-Selectin, and later ICAM-1 and VCAM-1, that leads eventually to extravasation of the white blood cell through the blood vessel wall into the extracellular matrix tissue. ELISA techniques have shown that detectable levels of soluble P-Selectin are present in the biological fluids of apparently normal individuals.
