## BACKGROUND

TSPAN33 is a homodimeric disulfide-linked member of the tetraspanin family that is predominantly expressed in erythroblasts. It plays an important role in normal erythropoiesis and in the differentiation of erythroid progenitor and is expressed in several lymphomas including Hodgkin's and Diffuse large B cell lymphoma and is expressed in some autoimmune diseases where B cells participate in the pathology. Full-length human TSPAN33 shares 96% amino acid identity with mouse TSPAN33.
