I. BACKGROUND

Chemokine (C-C motif) ligand 2 (CCL2), also called monocyte chemoattractant protein-1 (MCP-1) or, MCAF and TDCF, is a heparin-binding, 10-14 kDa member of the beta or CC family of chemokines. Currently, there are at least 26 human CC family members that generally range from 8-12 kDa in size. The majority of these chemokines are found on human chromosome 17 and all contain a typical three β -sheet/one α -helix structure (1-3). Human CCL2 cDNA encodes a 99 amino acid (aa) precursor protein with a 23 aa signal peptide and a 76 aa mature protein (1). Mature human CCL2 shares 78-79% aa identity with canine, porcine and equine CCL2, while mouse and rat express a form of CCL2 that is extended by 49 aa and shares only ~56% aa identity within the common region. Human CCL2 can, however, induce a response in murine cells (4). Fibroblasts, glioma cells, smooth muscle cells, endothelial cells, lymphocytes and mononuclear phagocytes can produce CCL2 either constitutively or upon mitogenic stimulation, but monocytes and macrophages appear to be the major source (1, 5). In addition to its chemotactic activity, CCL2 induces enzyme and cytokine release by monocytes, NK cells and lymphocytes, and histamine release by basophils that express its receptor, CCR2 (1). Additionally, it promotes Th2 polarization in CD4⁺Tcells (6). CCL2-mediated recruitment of monocytes to sites of inflammation is proposed to play a role in the pathology of atherosclerosis, multiple sclerosis and allergic asthma (7, 8).

II. OVERVIEW

A. PRINCIPLE OF THE ASSAY

This assay employs the quantitative sandwich enzyme immunoassay technique. A monoclonal antibody specific for human CCL2/MCP-1 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any human CCL2/MCP-1 present is bound by the immobilized antibody. After washing away any unbound substances, an enzyme-linked polyclonal antibody specific for human CCL2/MCP-1 is added to the wells. Following a wash to remove any unbound antibody-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of human CCL2/MCP-1 bound in the initial step. The color development is stopped and the intensity of the color is measured.

B. LIMITATIONS OF THE PROCEDURE

- **FOR RESEARCH USE ONLY NOT FOR USE IN DIAGNOSTIC PROCEDURES.**
- This kit is suitable for cell culture supernate and serum.
- The kit should not be used beyond the expiration date on the kit label.
- Do not mix or substitute reagents with those from other lots or sources.
- If samples generate values higher than the highest standard, dilute the samples with Calibrator Diluent and repeat the assay.
- Any variation in operator, pipetting technique, washing technique, incubation time or temperature, and kit age can cause variation in binding.

III. ADVANTAGES

A. PRECISION

Intra-assay Precision (Precision within an assay)

Three samples were tested twenty times on one plate to assess intra-assay precision.

Inter-assay Precision (Precision between assays)

Three samples were tested in twenty separate assays to assess inter-assay precision.

Sample	Intra-assay Precision			Inter-assay Precision		
	1	2	3	1	2	3
Mean (pg/mL)	33.0	129.9	481.7	33.7	130.5	528.8
Standard Deviation	1.6	5.6	26.0	1.3	6.0	40.3
CV%	4.8	4.3	5.4	4.0	4.6	7.6

B. RECOVERY

The recovery of human CCL2/MCP-1 spiked to different levels throughout the range of the assay in cell culture media was evaluated. The recovery ranged from 97.3-123.1% with an average of 109.5%.

The recovery of human CCL2/MCP-1 spiked to different levels throughout the range of the assay in human serum was evaluated. The recovery ranged from 82.1-114.3% with an average of 98.9%.

C. SENSITIVITY

The minimum detectable dose (MDD) of human CCL2/MCP-1 is typically less than 2.9 pg/mL.

The MDD was determined by adding two standard deviations to the mean optical density value of twenty zero standard replicates and calculating the corresponding concentration.

D. CALIBRATION

This immunoassay is calibrated against highly purified *E. coli*-expressed recombinant human CCL2/MCP-1 produced at R&D Systems.

E. LINEARITY

To assess the linearity of the assay, different samples were containing or spiked with high concentrations of human CCL2/MCP-1 and diluted with Calibrator Diluent (1×) to produce samples with values within the dynamic range of the assay.

Dilution	Average % of Expected	Range (%)
1:2	96.1%	87.2-102.6%

VI. PREPARATION

A. SAMPLE COLLECTION AND STORAGE

Cell Culture Supernates - Remove particulates by centrifugation and assay immediately or aliquot and store samples at $\leq -20^{\circ}\text{C}$. Avoid repeated freeze-thaw cycles. Samples may require dilution with Calibrator Diluent (1 \times).

Serum - Use a serum separator tube (SST) and allow samples to clot for 30 minutes at room temperature before centrifugation for 15 minutes at 1000 x g. Remove serum and assay immediately or aliquot and store samples at $\leq -20^{\circ}\text{C}$. Avoid repeated freeze-thaw cycles.

B. SAMPLE PREPARATION

Serum samples require a 2 fold dilution. A suggested 2-fold dilution is 100 μL of sample + 100 μL of Calibrator Diluent (1 \times).

C. REAGENT PREPARATION

Note: Bring all reagents to room temperature before use.

Wash Buffer - If crystals have formed in the concentrate, warm to room temperature and mix gently until the crystals have completely dissolved. Dilute 20 mL of Wash Buffer Concentrate (25 \times) into deionized or distilled water to prepare 500 mL of Wash Buffer.

Calibrator Diluent (1 \times) - Use deionized or distilled water to prepare Calibrator Diluent (1 \times).

Reagent Diluent (1 \times) - Use deionized or distilled water to prepare Reagent Diluent (1 \times).

Detection Antibody- Reconstitution Volume refer to vial label with Reagent Diluent (1 \times). Aliquot and store if needed. Dilute stock solution in Reagent Diluent (1 \times) to the working concentration of 25 ng/mL. Prepare at least 15 minutes prior to use.

Streptavidin-HRP B (1 \times) - Dilute to the working concentration specified on the vial label using Reagent Diluent (1 \times).

Substrate Solution - Color Reagent A and B should be mixed together in equal volumes within 15 minutes of use. Protect from light. 100 μL of the resultant mixture is required per well.

Human CCL2/MCP-1 Standard - Refer to the vial label for the reconstitution volume* using Calibrator Diluent (1 \times). This reconstitution produces a stock solution of 2000 pg/mL. Allow the standard to sit for a minimum of 15 minutes with gentle

agitation prior to making dilutions.

*if you have any question, please seek help from our Technical Support.

Pipette 300 μ L of Calibrator Diluent (1 \times) into each tube. Use the stock solution to produce a dilution series (below). Mix each tube thoroughly before the next transfer. The 1000 pg/mL standard serves as the high standard. The Calibrator Diluent (1 \times) serves as the zero standard (0 pg/mL).

D. TECHNICAL HINTS

- When mixing or reconstituting protein solutions, always avoid foaming.
- To avoid cross-contamination, change pipette tips between additions of each standard level, between sample additions, and between reagent additions. Also, use separate reservoirs for each reagent.
- It is recommended that the samples be pipetted within 15 minutes.
- To ensure accurate results, proper adhesion of plate sealers during incubation steps is necessary.
- Substrate Solution should remain colorless until added to the plate. Keep Substrate Solution protected from light. Substrate Solution should change from colorless to gradations of blue.
- Stop Solution should be added to the plate in the same order as the Substrate Solution. The color developed in the wells will turn from blue to yellow upon addition of the Stop Solution. Wells that are green in color indicate that the Stop Solution has not mixed thoroughly with the Substrate Solution.

VII. ASSAY PROCEDURE

Note: *Bring all reagents and samples to room temperature before use. It is recommended that all samples and standards be assayed in duplicate.*

1. Prepare all reagents and working standards as directed in the previous sections.
2. Remove excess microplate strips from the plate frame, return them to the foil pouch containing the desiccant pack, and reseal.
3. Add 100 μ L of Standard, or prepared sample per well. Cover with the adhesive strip provided. Incubate for 2 hours at room temperature. A plate layout is provided for a record of standards and samples assayed. (Samples may require dilution. See Sample Preparation section.)
4. Aspirate each well and wash, repeating the process two times for a total of three washes. Wash by filling each well with Wash Solution (400 μ L) using a squirt bottle, manifold dispenser, or autowasher. Complete removal of liquid at each step is essential to good performance. After the last wash, remove any remaining Wash Buffer by aspirating or decanting. Invert the plate and blot it against clean paper towels.
5. Add 100 μ L of the Detection Antibody diluted in Reagent Diluent to each well. Cover with a new adhesive strip and incubate 2 hours at room temperature.
6. Repeat the aspiration/wash as in step 4.
7. Add 100 μ L of the working dilution of Streptavidin-HRP B to each well. Cover the plate and incubate for 20 minutes at room temperature. Avoid placing the plate in direct light.
8. Repeat the aspiration/wash as in step 4.
9. Add 100 μ L of Substrate Solution to each well. Incubate for 20 minutes at room temperature. Avoid placing the plate in direct light.
10. Add 50 μ L of Stop Solution to each well. Gently tap the plate to ensure thorough mixing.
11. Determine the optical density of each well immediately, using a microplate reader set to 450 nm. If wavelength correction is available, set to 540 nm or 570 nm. If wavelength correction is not available, subtract readings at 540 nm or 570 nm from the readings at 450 nm. This subtraction will correct for optical imperfections

in the plate. Readings made directly at 450 nm without correction may be higher and less accurate.

12. **CALCULATION OF RESULTS**

Average the duplicate readings for each standard, control, and sample and subtract the average zero standard optical density (O.D.). Create a standard curve by reducing the data using computer software capable of generating a four parameter logistic (4-PL) curve-fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the y-axis against the concentration on the x-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the CCL2/MCP-1 concentrations versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data.

If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.

I. 背景

趋化因子(C-C基元)配体2 (CCL2), 又称为单核细胞趋化蛋白1(MCP-1)、或MCAF和TDCF, 是一种肝素结合的, 趋化因子 β 或CC家族的, 10-14kDa成员。目前, 至少有26个人类CC家族成员的大小在8-12kDa之间。这些趋化因子大多存在于人体17号染色体上, 均含有典型的3个 β -折叠和1个 α -螺旋结构 (1-3)。人CCL2 cDNA编码99个氨基酸(aa)的前体蛋白, 其中含23个aa信号肽和76个aa成熟蛋白 (1)。人成熟CCL2与犬、猪和马CCL2共有78-79%的aa同源性, 而小鼠和大鼠表达一种仅49个aa的CCL2, 在共同区域只有约56%的aa同源性。然而, 人CCL2可在小鼠细胞中诱导应答 (4)。成纤维细胞、胶质瘤细胞、平滑肌细胞、内皮细胞、淋巴细胞和单核吞噬细胞可以产生组成型的, 或在有丝分裂刺激下的CCL2, 但单核细胞和巨噬细胞似乎是其主要来源 (1, 5)。CCL2除了具有趋化活性外, 还诱导单核细胞、NK细胞和淋巴细胞释放酶和细胞因子, 以及诱导表达其受体CCR2的嗜碱性粒细胞释放组胺 (1)。此外, 它还促进CD4+T细胞中Th2的极化 (6)。CCL2介导的单核细胞向炎症部位的募集被认为在动脉粥样硬化、多发性硬化和过敏性哮喘的病理过程中起作用 (7, 8)。

II. 概述

A. 检测原理

本实验采用双抗体夹心ELISA法。抗人CCL2/MCP-1单抗包被于微孔板上，样品和标准品中的人CCL2/MCP-1会与固定在板上的抗体结合，游离的成分被洗去；加入辣根过氧化物酶标记的抗人CCL2/MCP-1多抗，未结合的抗体被洗去；溶液颜色与结合的目标蛋白成正比；加入终止液；用酶标仪测定吸光度。

B. 检测局限

VI. 实验前准备

A. 样品收集及储存

细胞培养上清液: 颗粒物应离心去除; 立刻检测样本。样本收集后若不及时检测, 需按一次使用量分装, 冻存于 -20°C 冰箱内, 避免反复冻融。样本可能需要用标准品稀释剂(1 \times)稀释。

血清样本: 用血清分离管(SST)分离血清。使血样室温凝集30分钟, 然后 $1000 \times g$ 离心15分钟。吸取血清样本之后即刻用于检测, 或者分装, -20°C 贮存备用。避免反复冻融。

B. 样本准备工作

血清样本需要用标准品稀释剂(1 \times) 2倍稀释后进行检测, 例如: $100 \mu\text{L}$ 血清+ $100 \mu\text{L}$ 标准品稀释剂(1 \times)。

C. 检测前准备工作

使用前请将所有试剂放置于室温

洗涤液: 从冰箱中取出的浓缩洗涤液可能有结晶, 属于正常现象; 放置室温, 轻摇混匀, 待结晶完全溶解后再配制洗涤液。可将 20mL 浓缩洗涤液用蒸馏水或去离子水稀释配置成 500mL 工作浓度的洗涤液。未用完的放回 4°C 。

标准品稀释剂(1 \times): 使用蒸馏水或去离子水稀释配置成标准品稀释剂(1 \times)。

试剂稀释液(1 \times): 使用蒸馏水或去离子水稀释配置成试剂稀释液(1 \times)。

检测抗体: 参考检测抗体瓶标签指示, 用试剂稀释液(1 \times)将冻干粉进行重溶。再用试剂稀释液(1 \times)稀释至工作浓度 25ng/mL , 至少在使用前15分钟准备。

链霉亲和素-HRP B: 用试剂稀释液(1 \times)将链霉亲和素-HRP B(40 \times)稀释至工作浓度链霉亲和素-HRP B(1 \times)。

显色剂: 按试验所需用量($100 \mu\text{L}/\text{孔}$)将显色液A和显色液B等体积混合, 避光保存, 现用现配, 须在15分钟内使用。

CCL2/MCP-1标准品: 冻干标准品的重溶体积请参考瓶身标签, 得到浓度为 2000pg/mL 标准品母液。轻轻震荡至少15分钟, 使其充分溶解。

*如有疑问, 请咨询我们的技术支持。

各稀释管中加入 $300 \mu\text{L}$ 标准品稀释剂(1 \times)。将标准品母液参照下图做系列稀释, 每管须充分混匀后再移液到下一管。 1000pg/mL 管作标准曲线最高点, 标准品稀释剂(1 \times)可用作标准品零点(0pg/mL)。

D. 技术小提示

- ◆ 当混合或重溶蛋白液时，尽量避免起沫；
- ◆ 为了避免交叉污染，配置不同浓度标准品、上样、加不同试剂都需要更换枪头。另外不同试剂请分别使用不同的移液槽；
- ◆ 建议15分钟内完成一块板的上样；
- ◆ 每次孵育时，正确使用封板胶纸可保证结果的准确性；
- ◆ 混合后的显色底物在上板前应无色，请避光保存；加入微孔板后，将由无色变成不同深度的蓝色；
- ◆ 终止液上板顺序应同显色底物上板顺序一致；加入终止液后，孔内颜色由蓝变黄；若孔内有绿色，则表明孔内液体未混匀，请充分混合。

VII. 操作步骤

使用前请将所有试剂和样本放置于室温，建议所有的实验样本和标准品做复孔检测

1. 按照上一节的说明，准备好所有需要的试剂和标准品；
2. 从已平衡至室温的密封袋中取出微孔板，未用的板条请放回铝箔袋内，重新封口；
3. 分别将不同浓度标准品，实验样本或者质控品加入相应孔中，每孔100 μ L。用封板膜封住反应孔，室温孵育2小时。说明书提供了一张96孔模板图，可用于记录标准品和试验样本的板内位置；（血清样本需要稀释，详情参见样本制备部分。）
4. 将板内液体吸去，使用洗瓶、多通道洗板器或自动洗板机洗板。每孔加洗涤液400 μ L，然后将板内洗涤液吸去。重复操作2次，共洗3次。每次洗板尽量吸去残留液体会有助于得到好的实验结果。最后一次洗板结束，请将板内所有液体吸干或将板倒置，在吸水纸拍干所有残留液体；
5. 在每个微孔内加入100 μ L配置好的检测抗体（用试剂稀释液稀释）。用封板胶纸封住反应孔，室温孵育2小时；
6. 重复第4步洗板操作；
7. 在每个微孔内加入100 μ L稀释好的链霉亲和素- HRP B工作液。用封板膜封住反应孔，室温孵育20分钟，**注意避光**；
8. 重复第4步洗板操作；
9. 在每个微孔内加入100 μ L显色剂，室温孵育20分钟，**注意避光**；
10. 在每个微孔内加入50 μ L终止液，请轻拍微孔板，使溶液混合均匀。孔内溶液颜色会从蓝色变为黄色；
11. 加入终止液后30分钟内，使用酶标仪测量450 nm的吸光度值，设定540 nm或570 nm作为校正波长。如果没有使用双波长校正，结果准确度可能会受影响；
12. **计算结果**：将每个标准品和样品的校正吸光度值（OD₄₅₀-OD₅₄₀/OD₅₇₀），复孔读数取平均值，然后减去平均零标准品OD值。使用计算机软件作四参数逻辑（4-PL）曲线拟合创建标准曲线。另一种方法是，可以通过绘制标准品浓度做对数与相应OD值对数生成曲线，并通过回归分析确定最佳拟合线。通过样本的OD值，可从标准曲线上得到样本中人CCL2/MCP-1的浓度。如果样品被稀释，从标准曲线读取的浓度必须乘以稀释倍数。
