PRODUCT INFORMATION & MANUAL

Mouse IFN-γ Valukine™ ELISA

Catalog Number: VAL607

For the quantitative determination of natural and recombinant mouse IFN-γ concentrations

For research use only.
Not for diagnostic or therapeutic procedures.

Bio-Techne China Co. Ltd

I. BACKGROUND

Interferon-gamma (IFN-γ, also known as type II interferon) is an important immunoregulatory cytokine that was originally identified through its anti-viral activity (1, 2). It plays key roles in host defense by exerting antiviral, antiproliferative, and immunoregulatory activities (3, 4). On many cell types, IFN-γ induces the production of cytokines and upregulates the expression of various membrane proteins including class I and II MHC antigens, Fc receptors, leukocyte adhesion molecules, and B7 family antigens. IFN-γ is a potent activator of macrophage effector functions. It directs the synthesis, class switching, and secretion of immunoglobulins by B cells. IFN-γ also influences T-helper cell phenotype development by inhibiting Th2 differentiation and stimulating Th1 development (3, 4). IFN-γ plays a central role in the progression of inflammatory diseases such as autoimmunity and atherosclerosis (5, 6).

Biologically active IFN-γ consists of a noncovalently linked homodimer of 20-25 kDa variably glycosylated subunits (7). Mature mouse IFN-γ shares 86% amino acid (aa) sequence identity with rat IFN-γ and 38-44% aa identity with bovine, canine, cotton rat, equine, feline, human, porcine, and rhesus IFN-γ. IFN-γ dimers bind to transmembrane IFN-γ RI (alpha subunits) which then interact with transmembrane IFN-γ RII (beta subunits) to form the functional receptor complex of two α and two β subunits (8, 9). Inclusion of IFN-γ RII in the receptor complex increases the ligand binding affinity as well as the efficiency of signal transduction (9, 10). Whereas the α-chain is expressed constitutively on many cell types, the cellular regulation of the β-chain correlates with an IFN-γ responsive state and is tightly regulated (8).

IFN-γ is produced by a number of cell types under inflammatory conditions, including dendritic epidermal/γδ T cells (11), keratinocytes (12), peripheral blood γδ T cells (13), mast cells (14), neurons (15), $CD8^+$ T cells (16), macrophages (17), B cells (18), neutrophils (19), NK cells (20), $CD4^+$ T cells (21), and testicular spermatids (22).

II. OVERVIEW

A. PRINCIPLE OF THE ASSAY

This assay employs the quantitative sandwich enzyme immunoassay technique. An antibody specific for mouse IFN-γ has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any mouse IFN-γ present is bound by the immobilized antibody. After washing away any unbound substances, an enzyme-linked antibody specific for mouse IFN-γ is added to the wells. Following a wash to remove any unbound antibody-enzyme reagent, TMB substrate (Chromogenic agent) is added to the wells and color develops in proportion to the amount of mouse IFN-γ bound in the initial step. The color development is stopped and the intensity of the color is measured.

B. LIMITATIONS OF THE PROCEDURE

- **FOR RESEARCH USE ONLY. NOT FOR USE IN DIAGNOSTIC PROCEDURES.**
- This kit is suitable for cell culture supernate and mouse serum.
- The kit should not be used beyond the expiration date on the kit label.
- Do not mix or substitute reagents with those from other lots or sources.
- If samples generate values higher than the highest standard, dilute the samples with appropriate calibrator diluent and repeat the assay.
- Any variation in operator, pipetting technique, washing technique, incubation time or temperature, and kit age can cause variation in binding.

III. ADVANTAGES

A. PRECISION

Intra-assay Precision (Precision within an assay)

Three samples were tested twenty times on one plate to assess intra-assay precision.

Inter-assay Precision (Precision between assays)

Three samples were tested in twenty separate assays to assess inter-assay precision.

CELL CULTURE SUPERNATE ASSAY

	Intra-assay Precision			**Inter-assay Precision**		
Sample	1	2	3	1	2	3
Mean (pg/mL)	44.8	156	518	43.3	144	509
Standard Deviation	2.2	5.0	14.2	3.6	14.7	48.6
CV%	4.9	3.2	2.7	8.3	10.2	9.5

SERUM ASSAY

	Intra-assay Precision			**Inter-assay Precision**		
Sample	1	2	3	1	2	3
Mean (pg/mL)	45.1	143	528	42.8	139	518
Standard Deviation	2.1	4.4	11.8	3.6	13.6	46.5
CV%	4.7	3.1	2.2	8.4	9.8	9.0

B. RECOVERY

The recovery of mouse IFN-γ spiked to three levels throughout the range of the assay in various matrices was evaluated.

Sample Type	**Average % Recovery**	**Range%**
Cell culture supernates (n=7)	105	98-115
Serum (n=5)	97	91-106

C. SENSITIVITY

The minimum detectable dose (MDD) of mouse IFN-γ is typically less than 2 pg/mL.

The MDD was determined by adding two standard deviations to the mean optical density value of twenty zero standard replicates and calculating the corresponding concentration.

D. CALIBRATION

This immunoassay is calibrated against highly purified *E. coli*-expressed recombinant mouse IFN-γ produced at R&D Systems.

The NIH reference preparation mouse IFN-γ Gg02-901-533 which was intended as a bioassay standard, was evaluated in this kit. Each ampule contains a nominal 1.0 µg of natural mouse IFN-γ and was assigned an arbitrary unitage of 1000 Units/ampule.

NIH Gg02-901-533: 1 Unit of standard = 230 pg of Valukine™ Mouse IFN-γ

E. LINEARITY

To assess the linearity of the assay, different samples were containing or spiked with high concentrations of mouse IFN-γ and diluted with appropriate calibrator diluent to produce samples with values within the dynamic range of the assay.

		Cell culture supernates (n=4)	**Serum (n=4)**
1:2	Average % of Expected	101	97
	Range (%)	99-104	92-101
1:4	Average % of Expected	101	95
	Range (%)	98-104	92-98
1:8	Average % of Expected	104	94
	Range (%)	100-110	91-96
1:16	Average % of Expected	100	92
	Range (%)	95-105	90-93

F. SAMPLE VALUES

Cell Culture Supernates:

Mouse splenocytes (2 x 10^6 cells/mL) were cultured for 3 days in RPMI plus 10% fetal bovine serum and stimulated with 10 µg/mL PHA. An aliquot of the cell culture

supernate was removed, assayed for mouse IFN-γ , and measured 32 ng/mL.

EL-4 mouse lymphoblast cells (9 x 10^5 cells/mL) were cultured for 2 days in DMEM plus 10% fetal bovine serum and stimulated with 10 µg/mL PHA and 10 ng/mL PMA. An aliquot of the cell culture supernate was removed, assayed for mouse IFN-γ, and measured 4 ng/mL.

Mouse lung conditioned media (1 lung, 1-2 mm pieces in 10 mL of medium) was collected after culturing for 5 days in RPMI plus 10% fetal bovine serum. An aliquot of the cell culture supernate was removed, assayed for mouse IFN-γ, and measured 198 pg/mL.

Mouse serum - Forty mouse serum samples were evaluated for the presence of mouse IFN-γ in this assay. Thirty-eight samples measured less than the lowest Mouse IFN-g Standard, 9.4 pg/mL. Two samples read 24 pg/mL and 60 pg/mL, respectively.

G. SPECIFICITY

This assay recognizes both natural and recombinant mouse IFN-γ. The following factors were prepared at 50 ng/mL in calibrator diluent RD5Y/RD6-12 and assayed for cross-reactivity. Preparations of the following factors at 50 ng/mL in a mid-range recombinant mouse IFN-γ control were assayed for interference. No significant cross-reactivity or interference was observed.

Recombinant mouse			**Recombinant human**
C10	IL-4	KC	IFN-γ
G-CSF	IL-5	LIF	
GM-CSF	IL-6	M-CSF	
IFN-γ RI	IL-7	MIP-1 α	
IFN-γ RII	IL-9	MIP-1 β	
IFN-κ	IL-10	MIP-2	
IL-1 α	IL-10 R	SCF	
IL-1 β	IL-12	TNF-α	
IL-2	IL-13	Tpo	
IL-3	JE	VEGF	

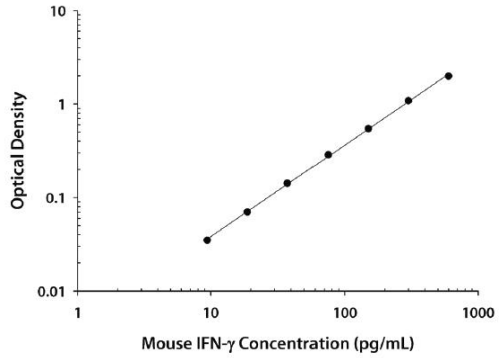

A sample containing 66 ng/mL of recombinant rat IFN-γ measured 27 pg/mL in this assay (0.04% cross-reactivity). Upon dilution, the dose-curve of the recombinant rat IFN-γ was parallel to the mouse IFN-γ standard curve.

IV. EXPERIMENT

EXAMPLE STANDARD

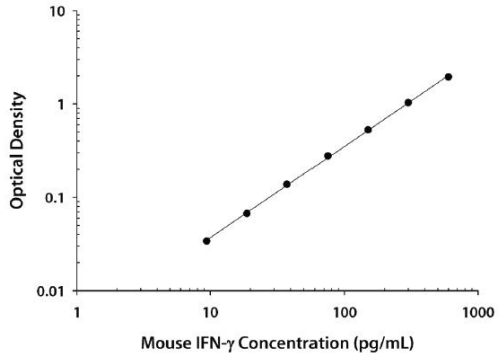

The standard curves are provided for demonstration only. A standard curve should be generated for each set of samples assayed.

CELL CULTURE SUPERNATE ASSAY

(pg/mL)	O.D.	Average	Corrected
0	0.042 0.043	0.042	—
9.4	0.077 0.077	0.077	0.035
18.8	0.113 0.112	0.112	0.070

V. KIT COMPONENTS AND STORAGE

A. MATERIALS PROVIDED

Parts	Description	Size
Mouse IFN-γ Microplate	96 well polystyrene microplate (12 strips of 8 wells) coated with an antibody against mouse IFN-γ	1 plate
Mouse IFN-γ Conjugate	Antibody against mouse IFN-γ conjugated to horseradish peroxidase	1 vial
Mouse IFN-γ Standard	Recombinant mouse IFN-γ in a buffered protein base; lyophilized. *Refer to the vial label for reconstitution volume.*	2 vials
Assay Diluent RD1-21	A buffered protein base with preservatives. May contain a precipitate. *Mix well before and during use.*	1 vial
Calibrator Diluent RD5Y	A buffered protein base used to dilute standard and samples. *For cell culture supernate samples*	1 vial
Calibrator Diluent RD6-12	A buffered protein base used to dilute standard and samples. *For serum samples*	1 vial
Wash Buffer Concentrate (25×)	A 25× concentrated solution of buffered surfactant	1 vial
TMB Substrate	TMB ELISA Substrate Solution/TMB Substrate Solution	1 vial
Stop Solution	Diluted hydrochloric acid solution	1 vial
Plate Sealers	Adhesive strip	3 strips

B. STORAGE

<table>

* Provided this is within the expiration date of the kit.

C. OTHER SUPPLIES REQUIRED

- Microplate reader capable of measuring absorbance at 450 nm, with the correction wavelength set at 540 nm or 570 nm.
- Pipettes and pipette tips.
- Deionized or distilled water.
- Squirt bottle, manifold dispenser, or automated microplate washer.
- 500 mL graduated cylinder.

D. PRECAUTION

- The Stop Solution provided with this kit is an acid solution.
- Some components in this kit contain a preservative which may cause an allergic skin reaction. Avoid breathing mist.
- TMB substrate may cause skin, eye, and respiratory irritation. Avoid breathing fumes.
- Wear protective gloves, clothing, eye, and face protection. Wash hands thoroughly after handling

VI. PREPARATION

A. SAMPLE COLLECTION AND STORAGE

The sample collection and storage conditions listed below are intended as general guidelines. Sample stability has not been evaluated.

Cell Culture Supernates - Remove particulates by centrifugation and assay immediately or aliquot and store samples at ≤ -20 °C. Avoid repeated freeze-thaw cycles.

Serum - Use a serum separator tube (SST) and allow samples to clot for 2 hours at room temperature before centrifugation for 20 minutes at 2000 × g. Remove serum and assay immediately or aliquot and store samples at ≤ -20 °C. Avoid repeated freeze-thaw cycles.

Note: *Grossly hemolyzed or lipemic samples may not be suitable for use in this assay.*

B. SAMPLE PREPARATION

Cell culture supernate samples may require a dilution.

Optimal dilutions should be determined by the end user.

C. REAGENT PREPARATION

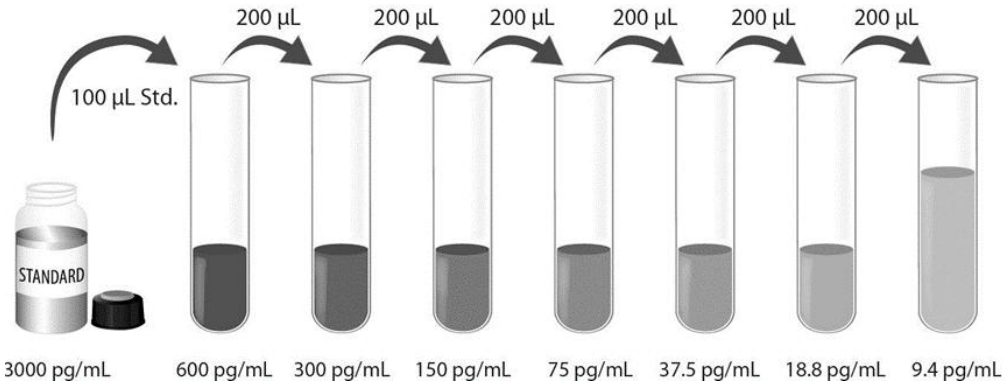

Note: *Bring all reagents to room temperature before use.*

Wash Buffer (1×) - If crystals have formed in the concentrate, warm to room temperature and mix gently until the crystals have completely dissolved. Dilute 20 mL of Wash Buffer Concentrate (25×) into deionized or distilled water to prepare 500 mL of Wash Buffer (1×).

Mouse IFN-γ Standard - Centrifuge briefly before opening. Refer to the vial label for reconstitution volume*. Reconstitute the Mouse IFN-γ Standard with Calibrator Diluent RD5Y (for cell culture supernate samples) or Calibrator Diluent RD6-12 (for serum samples). Do not substitute other diluents. This reconstitution produces a stock solution of 3000 pg/mL. Allow the standard to sit for a minimum of 5 minutes with gentle mixing prior to making dilutions.

*If you have any question, please seek help from our Technical Support.

Use polypropylene tubes. Pipette 400 µL of Calibrator Diluent RD5Y (for cell culture supernate samples) or Calibrator Diluent RD6-12 (for serum samples) into the 600 pg/mL tube. Pipette 200 µL of appropriate calibrator diluent into each remaining tube. Use the stock solution to produce a dilution series (below). Mix each tube thoroughly before the next transfer. The 600 pg/mL standard serves as the high standard. The appropriate calibrator diluent serves as the zero standard (0 pg/mL).

D. TECHNICAL HINTS

- When mixing or reconstituting protein solutions, always avoid foaming.
- To avoid cross-contamination, change pipette tips between additions of each standard level, between sample additions, and between reagent additions. Also, use separate reservoirs for each reagent.
- It is recommended that the samples be pipetted within 15 minutes.
- To ensure accurate results, proper adhesion of plate sealers during incubation steps is necessary.
- TMB Substrate should remain colorless until added to the plate. Keep TMB Substrate protected from light. TMB Substrate should change from colorless to gradations of blue.
- Stop Solution should be added to the plate in the same order as the TMB Substrate. The color developed in the wells will turn from blue to yellow upon addition of the Stop Solution. Wells that are green in color indicate that the Stop Solution has not mixed thoroughly with the TMB Substrate.

VII.ASSAY PROCEDURE

Note: *Bring all reagents and samples to room temperature before use. It is recommended that all samples and standards be assayed in duplicate.*

1. Prepare all reagents, samples and working standards as directed in the previous sections.
2. Remove excess microplate strips from the plate frame, return them to the foil pouch containing the desiccant pack, and reseal.
3. Add 50 µL of Assay Diluent RD1-21 to each well.
4. Add 50 µL of standard and sample per well. Mix by gently tapping the plate frame for 1 minute. Cover with the adhesive strip provided. **Incubate for 2 hours at room temperature.** A plate layout is provided for a record of standards and samples assayed.
5. Aspirate each well and wash, repeating the process four times for a total of five washes. Wash by filling each well with Wash Buffer (400 µL) using a squirt bottle, manifold dispenser, or autowasher. Complete removal of liquid at each step is essential to good performance. After the last wash, remove any remaining Wash Buffer by aspirating or decanting. Invert the plate and blot it against clean paper towels.
6. Add 100 µL of mouse IFN-γ conjugate to each well. Cover with a new adhesive strip. **Incubate for 2 hours at room temperature.**
7. Repeat the aspiration/wash as in step 5.
8. Add 100 µL of TMB Substrate to each well. **Incubate for 30 minutes at room temperature. Protect from light**.
9. Add 100 µL of Stop Solution to each well. Gently tap the plate to ensure thorough mixing.
10. Determine the optical density of each well within 10 minutes, using a microplate reader set to 450 nm. If wavelength correction is available, set to 540 nm or 570 nm. If wavelength correction is not available, subtract readings at 540 nm or 570 nm from the readings at 450 nm. This subtraction will correct for optical imperfections in the plate. Readings made directly at 450 nm without correction

may be higher and less accurate.

11. **CALCULATION OF RESULTS.** Average the duplicate readings for each standard and sample and subtract the average zero standard optical density. Create a standard curve by reducing the data using computer software capable of generating a four parameter logistic (4-PL) curve-fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the y-axis against the concentration on the x-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the mouse IFN-γ concentrations versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data.

    If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.

I. 背景

γ干扰素（IFN-γ，又称为II型干扰素）是一种重要的免疫调节细胞因子，因其具有抗病毒活性而被发现（1, 2）。IFN-γ通过其抗病毒、抗增殖和免疫调节功能在宿主防御过程中起关键作用（3, 4）。在许多类型的细胞中，IFN-γ诱导细胞因子在生产和上调多种膜蛋白的表达，包括I型和II型主要组织相容性复合体（MHC）抗原、Fc受体、白细胞黏附分子和B7家族抗原。IFN-γ是强大的巨噬细胞效应激活剂；它指导B细胞免疫球蛋白的合成、类型转变及分泌。IFN-γ通过抑制Th2细胞的分化和刺激Th1细胞的发育而影响T辅助细胞表型的发育（3, 4）。IFN-γ在自身免疫疾病和动脉粥样硬化等炎性疾病的恶化过程中起重要作用（5, 6）。

具有生物活性的IFN-γ是由两个非共价相连的具有不同程度糖基化的20-25 kDa亚基组成的同源二聚体（7）。成熟的小鼠IFN-γ与大鼠IFN-γ在氨基酸序列上享有86%的同源性，与牛、犬、棉鼠、马、猫、人、猪及恒河猴的IFN-γ有38-44%的同源性。IFN-γ二聚体先于跨膜IFN-γ RI（α亚基）集合，再与跨膜IFN-γ RII(β亚基) 结合，从而形成含有两个 α亚基和β亚基的活性受体复合体（8, 9）。受体复合体中的IFN-γ RII可增加配体的亲和力以及信号转导的效率（9, 10）。尽管α链在多种细胞类型中广泛表达， 受体β链却与IFN-γ的应答状态相关，其表达受到严格调控（8）。

在炎症条件下，IFN-γ可由多种类型的细胞产生，包括树突状表皮/γδ T细胞（11）、角质形成细胞（12）、外周γδ T细胞（13）、肥大细胞（14）、神经元（15）、$CD8^+$ T细胞（16）、巨噬细胞（17）、B 细胞（18）、中性粒细胞（19）、自然杀伤细胞（20）、$CD4^+$ T细胞（21）和睾丸精子细胞（22）。

II. 概述

A. 检测原理

本实验采用双抗体夹心ELISA法。抗小鼠IFN-γ抗体包被于微孔板上，样品和标准品中的小鼠IFN-γ会与固定在板上的抗体结合，游离的成分被洗去；加入辣根过氧化酶偶联的抗小鼠IFN-γ抗体孵育；洗涤去除未结合的试剂后，加入TMB底物溶液（显色剂），溶液颜色与结合的目标蛋白成正比；加入终止液；用酶标仪测定吸光度。

B. 检测局限

- **仅供科研使用，不可用于体外诊断；**
- 该试剂盒适用于细胞培养上清样本和小鼠血清；
- 请在试剂盒有效期内使用；
- 不同试剂盒及不同批号试剂盒的组分不能混用；
- 样本值若大于标准曲线的最高值，应将样本用相应的标准品稀释液稀释后重新检测；
- 检测结果的不同可由多种因素引起，包括实验人员的操作、移液器的使用方式、洗板技术、反应时间或温度、试剂盒的效期等。

III. 优势

A. 精确度

板内精确度（同一板内不同孔间的精确度）

已知浓度的三个样本，在同一板内分别检测20次，以确定板内精确度。

板间精确度（不同板之间的精确度）

已知浓度的三个样本，在不同板中分别检测20次，以确定板间精确度。

细胞培养上清

	板内精确度			板间精确度		
样本	1	2	3	1	2	3
平均值 (pg/mL)	44.8	156	518	43.3	144	509
标准差	2.2	5.0	14.2	3.6	14.7	48.6
CV%	4.9	3.2	2.7	8.3	10.2	9.5

血清

	板内精确度			板间精确度		
样本	1	2	3	1	2	3
平均值 (pg/mL)	45.1	143	528	42.8	139	518
标准差	2.1	4.4	11.8	3.6	13.6	46.5
CV%	4.7	3.1	2.2	8.4	9.8	9.0

B. 回收率

在不同类型样本中掺入检测范围内三个水平的小鼠IFN-γ，测定其回收率。

样本类型	平均回收率（%）	范围（%）
细胞培养基 (n=7)	105	98-115
血清 (n=5)	97	91-106

C. 灵敏度

小鼠IFN-γ的最低可测值一般小于2 pg/mL。
MDD是根据20个重复的零标准品孔的吸光度值的平均值加两倍标准差计算得到的相对应浓度。

D. 校正

此 ELISA 试剂盒以 R&D Systems 生产的大肠杆菌表达的高纯度重组小鼠 IFN-γ蛋白所校正。

本试剂盒对 NIH 参考物质小鼠 IFN-γ Gg02-901-533 进行了评估。每支安瓿瓶中含有标称 1 μg 的天然小鼠 IFN-γ，并被赋予 1000 U/安瓿的任意单位值。

NIH Gg02-901-533:1 单位标准品相当于 230pg Valukine 小鼠 IFN-γ。

E. 线性

不同的样本中含有或掺入高浓度的小鼠 IFN-γ，然后用相应的标准品稀释液将样本稀释到检测范围内，测定其线性。

		细胞培养上清(n=4)	血清(n=4)
1:2	Average % of Expected	101	97
	Range (%)	99-104	92-101
1:4	Average % of Expected	101	95
	Range (%)	98-104	92-98
1:8	Average % of Expected	104	94
	Range (%)	100-110	91-96
1:16	Average % of Expected	100	92
	Range (%)	95-105	90-93

F. 样本预值

细胞培养上清液：

小鼠脾细胞（2 × 10^6个细胞/mL）在含10%胎牛血清的RPMI培养基中培养3天，并用10 μg/mL的PHA刺激。取出一份细胞培养上清液，检测小鼠IFN-γ，测得浓度为32 ng/mL。

EL-4小鼠淋巴母细胞（9 × 10^5个细胞/mL）在含10%胎牛血清的DMEM培养基中培养2

天，并用10 μg/mL的PHA和10 ng/mL的PMA刺激。取出一份细胞培养上清液，检测小鼠IFN-γ，测得浓度为4 ng/mL。

小鼠肺条件培养基（1个肺，切成1-2毫米小块，置于10 mL培养基中）在含10%胎牛血清的RPMI培养基中培养5天后收集。取出一份细胞培养上清液，检测小鼠IFN-γ，测得浓度为198 pg/mL。

小鼠血清样本-用本试剂盒检测了40份小鼠血清样本中IFN-γ的水平。其中38个样品检测值低于小鼠IFN-γ最低标准9.4 pg/mL，其余2个样品检测值分别为24 pg/mL和60 pg/mL

G. 特异性

此ELISA法可检测天然及重组小鼠IFN-γ蛋白。将以下因子用标准品稀释液RD5Y/RD6-12配制成50 ng/mL的浓度来检测与小鼠IFN-γ的交叉反应。将50 ng/mL的干扰因子掺入中间范围的重组小鼠IFN-γ对照品中，检测对小鼠IFN-γ的干扰。没有观察到明显的交叉反应或干扰。

Recombinant mouse			**Recombinant human**
C10	IL-4	KC	IFN-γ
G-CSF	IL-5	LIF	
GM-CSF	IL-6	M-CSF	
IFN-γ RI	IL-7	MIP-1α	
IFN-γ RII	IL-9	MIP-1β	
IFN-κ	IL-10	MIP-2	
IL-1α	IL-10 R	SCF	
IL-1β	IL-12	TNF-α	
IL-2	IL-13	Tpo	
IL-3	JE	VEGF	

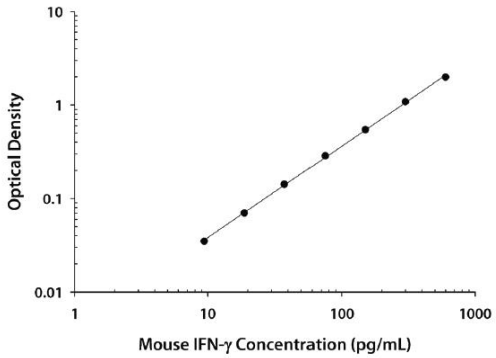

一份含有66 ng/mL重组大鼠IFN-γ的样品在本测定中测得27 pg/mL（交叉反应性为0.04%）。稀释后，重组大鼠IFN-γ的剂量曲线与小鼠IFN-γ标准曲线平行。

IV. 实验

标准曲线实例

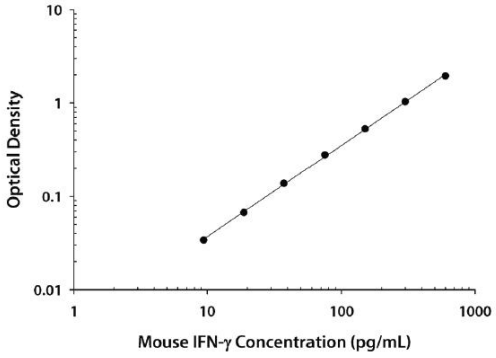

该标准曲线数据仅供参考，每次实验应绘制其对应的标准曲线。

CELL CULTURE SUPERNATE ASSAY

V. 试剂盒组成及储存

A. 试剂盒组成

组成	描述	规格
Mouse IFN-γ Microplate	包被小鼠IFN-γ抗体的96孔聚苯乙烯板，8孔×12条	1块板
Mouse IFN-γ Conjugate	酶标检测小鼠IFN-γ抗体	1瓶
Mouse IFN-γ Standard	小鼠IFN-γ标准品（冻干粉），溶于含防腐剂的缓冲蛋白基质中，参考瓶身标签进行重溶	2瓶
Assay Diluent RD1-21	检测液RD1-21。*可能含有沉淀。使用前及使用过程中请充分混匀。*	1瓶
Calibrator Diluent RD5Y	标准品稀释液RD5Y，*适用于细胞培养上清样本*	1瓶
Calibrator Diluent RD6-12	标准品稀释液RD6-12，*适用于血清样本*	1瓶
Wash Buffer Concentrate（25×）	浓缩洗涤缓冲液（25×）	1瓶
TMB Substrate	TMB ELISA底物溶液/TMB底物溶液	1瓶
Stop Solution	终止液	1瓶
Plate Sealers	封板膜	3张

B. 试剂盒储存

</table>

*必须在试剂盒有效期内。

C. 实验所需自备试验器材

- 酶标仪（可测量450 nm检测波长的吸收值及540 nm或570 nm校正波长的吸收值）；
- 高精度加液器及一次性吸头；
- 蒸馏水或去离子水；
- 洗瓶（喷瓶）、多通道洗板器或自动洗板机；
- 500 mL量筒；

D. 注意事项

- 本试剂盒提供的终止液为酸性溶液。
- 试剂盒中的一些组分含有防腐剂，可能引起皮肤过敏反应，避免吸入。
- TMB底物溶液可能造成皮肤，眼睛和呼吸道刺激，避免吸入。
- 穿戴防护手套、防护服、眼罩和面罩。操作后彻底清洗双手。

VI. 实验前准备

A. 样品收集及储存

以下样本采集和储存条件仅供一般性参考。样本稳定性尚未经过评估。

细胞培养上清液：颗粒物应离心去除；立刻检测样本。样本收集后若不及时检测，需按一次使用量分装，冻存于≤ -20℃冰箱内，避免反复冻融。

血清样本: 用血清分离管(SST)分离血清。使血样室温凝集2小时，然后2000 × g离心20分钟。吸取血清样本之后即刻用于检测，或者分装，≤ -20℃贮存备用。避免反复冻融。

注意： *明显溶血或脂血的样本不适用于本检测*

B. 样本准备工作

细胞培养上清液样本可能需要进行稀释处理。最佳稀释比例由最终用户确定。

C. 试剂准备工作

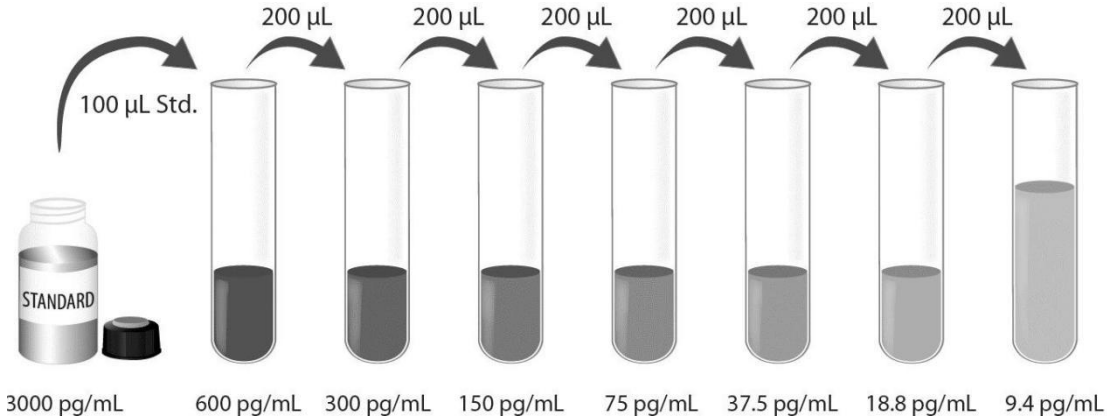

使用前请将所有试剂放置于室温。

洗涤液（1×）：从冰箱中取出的浓缩洗涤液可能有结晶，放置室温，轻摇混匀，待结晶完全溶解后再配制洗涤液。可将20 mL浓缩洗涤液（25×）用蒸馏水或去离子水稀释配制成500 mL工作浓度的洗涤液（1×）。

小鼠IFN-γ标准品：开盖前请瞬时离心。冻干标准品的重溶体积请参考瓶身标签。使用标准品稀释液RD5Y（适用于细胞培养上清样本）或校准品稀释液RD6-12（适用于血清样本）重溶小鼠IFN-γ标准品。请勿使用其他稀释液替代。此重溶步骤可制备出浓度为3000 pg/mL的标准储备液。在进行梯度稀释前，应将标准品静置至少5分钟，并轻柔混匀。

*如有疑问，请咨询我们的技术支持。

使用聚丙烯管。在600 pg/mL稀释管中加入400 µL标准品稀释液RD5Y（对于细胞培养上清样品）或标准品稀释液RD6-12（对于血清样品），其余每个稀释管中加入200 µL相应的稀释液。将标准品母液参照下图做系列稀释，每管须充分混匀后再移液到下一管。标准品600 pg/mL可用作标准曲线最高点，使用相应的标准品稀释液可用作标准曲线零点（0 pg/mL）。

D. 技术小提示

- 当混合或重溶蛋白液时，尽量避免起沫；
- 为了避免交叉污染，配制不同浓度标准品、上样、加不同试剂都需要更换枪头。另外不同试剂请分别使用不同的移液槽；
- 建议15分钟内完成一块板的上样；
- 每次孵育时，正确使用封板膜可保证结果的准确性；
- TMB底物溶液在上板前应为无色，请避光保存；加入微孔板后，TMB底物将由无色变成不同深度的蓝色；
- 终止液上板顺序应同TMB底物溶液上板顺序一致；加入终止液后，孔内颜色由蓝变黄；若孔内有绿色，则表明孔内液体未混匀请充分混合。

VII.操作步骤

使用前请将所有试剂和样本放置于室温，建议所有的实验样本和标准品做复孔检测。

1. 按照上一节的说明，准备好所有需要的试剂、样本和标准品；
2. 从已平衡至室温的密封袋中取出微孔板，未用的板条请放回铝箔袋内，重新封口；
3. 在每个微孔中加入50 µL检测液RD1-21；
4. 分别将不同浓度标准品和实验样本加入相应孔中，每孔50 µL。轻轻敲击板框1分钟以混合均匀。用封板膜封住反应孔，**室温孵育2小时**。说明书提供了一张96孔模板图，可用于记录标准品和试验样本的板内位置；
5. 将板内液体吸去，使用洗瓶、多通道洗板器或自动洗板机洗板。每孔加洗涤液400 µL，然后将板内洗涤液吸去。重复操作4次，共洗5次。每次洗板尽量吸去残留液体会有助于得到好的实验结果。最后一次洗板结束，请将板内所有液体吸干或将板倒置，在吸水纸拍干所有残留液体；
6. 在每个微孔内加入100 µL小鼠IFN-γ酶标检测抗体。用封板膜封住反应孔，**室温孵育2小时；**
7. 重复第5步洗板操作；
8. 在每个微孔内加入100 µL TMB底物溶液，**室温孵育30分钟。注意避光；**
9. 在每个微孔内加入100 µL终止液，请轻拍微孔板，使溶液混合均匀；
10. 加入终止液后10分钟内，使用酶标仪测量450 nm的吸光度值，设定540 nm或570 nm作为校正波长。如果波长校正不可用，以450 nm的读数减去540 nm或570 nm的读数。这种减法将校正酶标板上的光学缺陷。没有校正而直接在450 nm处进行的读数可能会更高且更不准确；
11. **计算结果：**将每个标准品和样品的复孔吸光值取平均值，然后减去零标准品平均OD值（O.D.），使用计算机软件作四参数逻辑（4-PL）曲线拟合创建标准曲线。另一替代方法是，通过绘制y轴上每个标准品的平均吸光值与x轴上的浓度来构建标准曲线，并通过图上的点绘制最佳拟合曲线。数据可以通过绘制小鼠IFN-γ浓度的对数与O.D.的对数来线性化，并且最佳拟合线可以通过回归分析来确定。该程序将产生足够但不太精确的数据拟合。

    如果样品被稀释，从标准曲线读取的浓度必须乘以稀释倍数。
