<b>Product Description</b>	
<b>Description</b>	The NFκB p65 ELISA kit allows the accurate measurement of total and phosphorylated human NFκB p65 in cell lysates. This ELISA uses the traditional sandwich ELISA format, but with a major difference: both the sample and the assay reagents can be added to the assay microplate at the same time. Since the antibodies are not precoated in the wells, several different targets can be analyzed simultaneously in the same plate in different wells. With this kit a mixture of capture and detection antibodies against either phosphorylated or total NFκB can be added to the sample lysate, thus enabling their detection with a simple 1-hour protocol.
