Images

Western Blot: Adenylate Cyclase 3 Antibody [NBP3-05527] - used at a dilution of 1:1,000, in green. [1] protein standard, [2] rat hippocampus, [3] mouse hippocampus, [4] mouse frontal cortex, and [5] cow frontal cortex, [6] protein standard, [7] non-transfected HEK293 cells, and [8] HEK293 cells transfected with DNA expressing Myc-DDK tagged full length human Adenylate Cyclase 3 from the appropriate cDNA. This antibody detects variably glycosylated forms of Adenylate Cyclase 3 protein with apparent molecular weights from ~120kDa and higher. The strong band at about 130kDa demonstrates overexpression of the Adenylate Cyclase 3 protein, and those over 250kDa double band presumably corresponds to heavily glycosylated or aggregated forms of Adenylate Cyclase 3. The same blot was simultaneously probed with mouse monoclonal antibody to GAPDH at a dilution of 1:5,000, in red, which reveals the single GAPDH band at ~37kDa in both transfected and non-transfected cells.

Immunocytochemistry/Immunofluorescence: Adenylate Cyclase 3 Antibody [NBP3-05527] - Immunofluorescence analysis of rat cortex section stained with Adenylate Cyclase 3 Antibody at a dilution of 1:10,000, in red and costained with mouse monoclonal antibody to the myelin and oligodendrocyte marker CNP at a dilution of 1:1,000 in green. The blue is Hoechst staining of nuclear DNA. The Adenylate Cyclase 3 Antibody reveals neuronal cilia while the CNP antibody stains oligodendrocytes and the myelin sheath around axons.
